Manufacturing beautifully designed stainless steel products since 1919

Welcome to Pland, an independent UK manufacturing group with a worldwide reputation for high quality innovative products in stainless steel. We have been based on the same site in Leeds since 1919 where we now operate from a 65,000 square foot design and manufacturing facility.

Pland is a company dedicated to delivering high quality stainless steel products that offer real value for money. Our breadth of knowledge and experience, underpinned by outstanding service levels enable us to provide the right solutions tailored to the needs of each of our customers. With a full design and manufacturing service we can deliver a one off bespoke product right through to a full turnkey solution. Our aim is to be the professionals' supplier of choice and with more than 95 years' experience in pressing and fabrication of stainless steel we can justifiably claim to be experts in this field.

Pland specialist stainless steel products are found in a wide variety of applications and environments including autopsy theatres, battleships, MOD field kitchens, offshore platforms, commercial refrigerators and catering appliances. Our products are also increasingly being used in domestic installations where their appearance, ease of maintenance and durability offer considerable advantages.

From our specialist manufacturing site in Leeds our customers are always assured of a highly professional and bespoke service from enquiry to delivery and beyond.

Pland. A history in stainless steel.

Proud of Our British Heritage

Please take a trip through some of the key milestones in our history and you will see how we combined 95 years of traditional skills with the latest sheet metal work technology to become the UK's leading stainless steel specialist.

1919

Established as Taylor Rustless Fittings on its current site in Leeds making stainless fittings for butcher's shops.

1970's

Press work division developed Bain Marie containers for kitchens, floats for the petrochemical industry, small back bar fryers, food containers for MOD field kitchen systems, Admiralty wash basins, towel rails, shelves and soap dishes.

1930's

Company expanded into heavy fabrication making large fermentation brewing and cooking vessels for the canning industry.

1936

The Stainless Steel Sink Company became the UK's 1st stainless steel sink manufacturer.

1940's

Presswork bay added and pioneered the production of stainless steel domestic sinks. Produced under 'The Stainless Steel Sink Company' a sub division of TRF Pland.

1970's

Moved into manufacturing heavy commercial sinks and accompanying stainless steel tables for schools and hotels along with a hygiene wash basin.

GRADE
316

End of the 1970's

Developed 316 grade sinks for the laboratory furniture industry and became the UK's major producer in this area.

Early 1990's

Pland expanded its healthcare range manufacturing a full range of scrub up troughs, sink bowls, janitorial units and slop hoppers.

1993

Planet Kitchen systems integrated into the Pland range adding stainless steel work tops and colour options - became widely used by local authorities, care homes, constabulary and fire service for their kitchens.

2002

Acquired Santric - manufacturers of high quality washroom and sanitary ware products.

2002

Began production of stainless steel sanitaryware - WC's, urinals, washbasin ranges, wash troughs, circular wash fountains, and shower cubicles. Widely used for schools, stadiums, nightclubs, prisons and industrial facilities.

2004

Improved design and developed by implementing state of the art 3D CAD/CAM modelling system.

2001

Acquired Associated Metal - experts in major turnkey projects.

2009

Continued development in the healthcare market with more specific use products being delivered, for example foot wash facilities for the multi-faith areas within hospitals.

2015

Pland

Strength in stainless steel

Our knowledge and experience make us the experts in stainless steel

Stainless steel is a clean, maintenance free, contemporary material used in many industries as well as its well-known use in household goods.

All stainless steels have a high resistance to corrosion compared to mild steel, different grades having different resistance depending on the number and quantity of other elements incorporated into the alloy. Unlike mild steels, there is no need to apply protective coatings or galvanising to stainless steel.

Stainless steel is the generic name for a number of different alloys of iron used primarily for their resistance to corrosion. The key element is that they all have a minimum percentage of 10.5% chromium, although more is used in the grades fabricated by Pland. Other metallic elements particularly nickel and molybdenum may be added but the incorporation of chromium is the determining factor.

Chromium has a great affinity for oxygen and during manufacture of the steel a little of the chromium in the alloy forms a passive chromium-rich oxide layer that forms naturally on the surface of the steel. Although extremely thin, only 1 to 5 nanometres, this protective layer is invisible, inert, tightly adhering and self-renewing. Because it is inert it will not react or influence other materials; its tight adherence means that it clings to the steel and its self-renewing property means that if damaged the protective film reforms immediately.

Stainless steel was first discovered in the UK, by Harry Brearley in August 1913 in Sheffield. It contained 0.24% carbon and 12.8% chromium and was the result of his work to solve the problem of the insides of rifle barrels being eroded through heat and the chemical action of discharge gases. He started by experimenting with steels containing chromium because they were known to have a higher melting point

than ordinary steels. Brearley found that his new steel strongly resisted chemical attack. He then exposed samples to vinegar, lemon juice and other food acids and found the same result. This discovery, and the fact that stainless steel edges could be continually sharpened without rusting, led to its first application, for knife blades.

Within a year of Brearley's discovery, Krupp in Germany was experimenting by adding nickel to the alloy. Brearley's steel could only be supplied in hardened and tempered condition whilst the Krupp steel was not only more resistant to acid attack but was more ductile and thus easier to work. From these two inventions were developed the 400 series of martensitic and 300 series of austenitic stainless steels. Most of the standard grades in use today had been created by 1935. Once these standard grades became established, experimentation changed to finding more economic production methods.

Advantages of stainless steel

Corrosion resistance - Stainless steel of the appropriate grade will not be affected by its surrounding environment because its corrosion resistance helps to ensure that the surface remains unblemished.

Fire and heat resistance - Special high chromium and nickel alloyed grades resist scaling and retain strength at high temperatures.

Hygiene - That stainless steel is easy to clean makes it the first choice for applications involving strict hygiene conditions such as hospitals, laboratories, kitchens, abattoirs and other food processing plants.

Aesthetic appearance - The bright, easily maintained surface of stainless steel provides a modern and attractive appearance.

Strength-to-weight advantage - The work hardening property of austenitic grades, which results in a significant strengthening of the material after cold working, allows reduced material thickness over conventional steel grades. This results in cost savings as well as weight savings over other materials.

Ease of fabrication - Modern steel-making techniques mean that with the right equipment stainless steel can be cut, welded, formed, machined and fabricated as easily as traditional steels.

Impact resistance - The 300 series steels used by Pland provide high toughness, from elevated temperatures to far below freezing, making these steels particularly appropriate to catering applications.

Long term value - When total life cycle costs are considered, stainless steel is usually the least expensive option for many applications.

The most common use of stainless steel is in cutlery, with grades 409 and 430 being used for everyday ware and the finest Sheffield cutlery using specially produced 410 and 420 for the knives and 304 for the spoons and forks.

Grade 304 is more ductile and therefore suitable for objects that need to be shaped such as sinks and washbasins. Grade 316 is a more corrosion resistant alloy than 304.

The benefits of this versatile material range from the cutting edges of knives to the formability and hygiene factors in sinks, from the strength and wear resistance in washing machine drums to the aesthetic appearance of hollow ware and pots and pans.

This leads to the important point that the initial investment cost of producing a component or fabrication in stainless steel will generally be more expensive than using ordinary steel. This is not just because of the higher alloy cost, but also because it

requires more work to shape and form. However the considerably better life cycle costs of stainless steel make it attractive because of much longer service life, lower maintenance cost and high scrap value on decommissioning and recycling.

Durability

GRADE

304

GRADE

316

There are more than 60 grades of stainless steel. However, the entire group can be divided into five classes. Each is identified by the alloying elements which affect their microstructure and for which each is named. The different families of stainless steels, ferritic, martensitic, precipitation-hardening, duplex and cast have a greater or less resistance to corrosion and differing hardening and strength characteristics. Pland uses stainless steel from the austenitic family of alloys which contain chromium, nickel and molybdenum. The grades used by Pland, 304 and 316, provide strength and corrosion resistance whilst being appropriate for the forming processes used to create washroom and sanitaryware products. All stainless steel contains a large proportion of iron; even highly alloyed grades such as 316 are a minimum of 62% iron.

304 grade

304 (EN 1.4301 or SS 2333; AFNORZ 6 CN 18-09; BS 304S31) is the basic chromium nickel austenitic stainless steel and has been found suitable for a wide range of applications. It is the most readily available in a variety of product forms. This grade is easy to form and fabricate with excellent resistance to corrosion.

316 grade

316 (EN1.4401 or SS 2347; AFNOR Z7 CND 17-11-01; BS 316S31) offers even greater corrosion resistance through the addition of molybdenum. This grade is desirable where the possibility of severe corrosion exists, such as heavy industrial atmospheres and marine environments.

The longevity of stainless steel is the result of the composition of the alloy and, therefore, it has a natural corrosion resistance. Nothing is applied to the surface that could add additional material to the environment. It does not need additional systems to protect the base metal, the metal itself will last.

Stainless steel's durability is further enhanced by some of its other physical and chemical properties. It is impervious to soot deposits, acid rain, bitumen compounds, cement or lime mortar, contact with timbers and wood-based sheets and fungi and mould. On a galvanic scale stainless steel is at the noble metal end and thus will not deteriorate when in contact with other metals.

Composition

304 grade composition

Carbon	0.04%	(max)
Nitrogen	0.05%	(max)
Chromium	18.10%	(min)
Nickel	8.30%	

316 grade composition

Carbon	0.03%	(max)
Nitrogen	0.03%	(max)
Chromium	17.10%	(min)
Nickel	10.70%	
Molybdenum	2.10%	

Sheet Thickness

Pland principally uses sheet stainless steel to fabricate washroom, sanitaryware and other products. Modern stainless steel is supplied in metric thicknesses and the table allows specifiers to convert Imperial Gauge thicknesses into millimetre equivalents.

Pland always source from reliable steel mill suppliers with an agreed contract to guarantee continuity of supply and quality standards. The standards applicable to stainless steel are continually being revised. We ensure that raw material used complies with British and European Standards.

Pland generally work in the range 0.9mm – 3mm. We do not compromise material thickness to reduce cost. We will always select the most appropriate gauge for the product and its environment. For specialist projects we are happy to discuss the project requirements and advise on sheet thickness and stainless steel grades at the outset.

Sheet Thickness

Imperial Gauge	Imperial in mm	Metric Sheet mm
10	3.25	3.0
12	2.64	2.5
14	2.03	2.0
16	1.63	1.5
18	1.22	1.2
20	0.9	0.9
22	0.7	1.7
24	0.56	0.6
26	0.46	0.5

Manufacture

Recent investments include CNC Laser cutting, 8 axis CNC bending and high specification CAD software.

We have several triple action hydraulic presses, ranging from 150 to 800 tonnes, for deep drawing stainless steel. Our largest press is a 5000 tonnes rubber press. This is used for shallow pressing

sink tops, trolley trays, refrigerator panels, container panels and catering equipment tops.

Our most important asset by far is our workforce, most of whom are highly skilled. They understand the importance of our customers and take great pride in the quality of our products.

We are fully accredited to ISO 9001 and are 2nd tier suppliers to the Ministry of Defence.

Care and maintenance

With minimal care stainless steel will last a lifetime. As for any product, some maintenance is necessary but with Pland stainless steel equipment this is simplicity itself. A regular wash with mild detergent and polishing dry with a soft cloth is all that is needed. Never use scouring powders or steel wool as they can scratch the surface. Perforated rubber or plastic mats in sinks will reduce opportunities for scratching and marking by pans and tableware.

Stainless steel resists stains well but occasionally it might dull or show greasy finger marks. Some foods (milk and milk products and acidic foods such as ketchup, mustard, mayonnaise, lemon juice, vinegar, salt, salad dressings) should be rinsed thoroughly off the surface promptly or they could affect it.

Cooked-on food or grease can be removed by using a fine abrasive cleaning powder or a paste of baking soda and water. Other tips for polishing stainless steel are:

- Rub with olive oil or club soda to remove streaks.
- To clean and brighten stainless steel, moisten a cloth with undiluted white or cider vinegar and wipe clean. Bright stainless steel finishes should not be cleaned with bleach, creams or abrasive materials such as wire wool or silver dip.

Commercial stainless steel cleaners are also available. Most satin finish stainless steel has a grain; if using any kind of abrasive on a satin stainless steel surface, always make sure it is cleaned in the direction of the grain. 'White' areas can be rubbed out with a very fine Scotchbrite pad but make sure it is along the grain lines and not at right angles to them.

Health & Environment

The excellent hygienic properties of stainless steel are recognised by its use for surgical instruments and medical implants, as well as in food and drink processing, catering and washroom installations. It's smooth, neutral surface makes it difficult for bacteria to adhere and survive, and it is also very easy to clean, so strict standards of hygiene are possible at every stage of the process.

Stainless steel is 100% recyclable and therefore less harmful to the environment than many other materials in common use. The production process uses stainless steel scrap as its primary raw material and new stainless steel comprises over 70% recycled material. This percentage is increasing as the use of stainless steel expands.

The main component of stainless steel is scrap iron, of which there is no shortage. Other metallic elements alloyed with the iron are chromium and molybdenum which are plentiful within the earth's crust. Nickel, which comprises around 10% of the standard austenitic stainless steel grades, is less abundant but is not in short supply and is being recycled effectively.

The quantity of energy required for manufacture of a product, the embodied energy, is of growing concern to environmentalists. More efficient process technology has allowed steelmakers to significantly reduce the amount of energy used in the production of stainless steel over the past two decades. Stainless steel's low thermal conductivity makes

soldering and welding more energy efficient than with many other metals.

Stainless steel washroom and sanitaryware has a life expectancy of at least decades and possibly centuries, meaning that energy and other costs of manufacture are spread over a very long period indeed. Even at the end of its life, more commonly the result of fashion or aesthetics rather than wear and tear, the material has a high scrap value and can be completely recycled.

As a result, stainless steel can provide the most economic long term solution compared with other materials. This is especially true when maintenance costs over the lifetime of an installation are taken into account. Stainless steel can be maintained without the need for either repainting or resurfacing, frequently making the most cost effective solution over the life cycle of a project.

A huge range of well designed, innovative stainless steel products for the job in hand.

Our aim is to offer Pland customers the largest range and highest quality of stainless bowls, sinks, sanitaryware and washroom products. All from one source and always competitively priced. From our manufacturing centre in Leeds in which quality and care are paramount, we deliver nationwide and usually from stock. With continuous investment in equipment and technology and a companywide culture of always putting the customer first, you can be sure that Pland will deliver what you need when you need it.

This compendium shows our standard products, of which there are many. In reality however, a significant portion of our business is providing tailor made solutions for manufacturers and designers from a vast array of business sectors. If you have a requirement for a single stainless steel product or a complete turnkey project please do not hesitate to contact us. You are always welcome to visit our facilities to view our products and capabilities at first hand.

Pland for Catering

Stainless steel's beneficial properties have led to its application throughout the food chain. From food processing and brewing, through distribution and storage to serving food, installing Pland stainless steel catering equipment brings unique benefits to the food industry.

One of the great advantages of stainless steel is that it imparts no taste to the food that is prepared on it. Typical uses include kitchens, dairies, ham curing and fish storage. The grades used by Pland are 304 (1.4301), for normal temperatures and low acid concentrations, and 316 (1.4401) for harsher environments. For example 304 (1.4301) is used in cheese production, but where salted ham is being prepared 316 is used. In ice cream production 316 (1.4401) is specified because strong anti-bacteriological cleaning and rinsing systems are used.

A further advantage is that stainless steel is resistant to damage caused by condensation cycles in high humidity areas such as kitchens.

Strength in stainless steel

Burgundy - Catering sink 600mm wide

CS1560DR4F

CS1560DR4F

Satin finish catering sink with working height of 850mm and 600mm projection from wall, compatible with Pland catering tables. Available from stock as single bowl (three sizes) or double bowls with left or right hand drainer. Supplied with waste kit, earth tag, sound deadening pads, stand supplied with adjustable feet for levelling. Standard product without taps. Sinks and stands available separately. Selected 316 grade sinks supplied as an option.

Jura - Café Catering sink 600mm wide

CC1060SL

CC1060SL

Jura Satin finish café catering sinks with 600mm projection from wall are ideal for applications where space is at a premium and the user is looking for a cost-effective solution to meet the needs of a smaller catering establishment/café. Designed to fit proprietary highline base units as standard, these give all the benefits of a commercial stainless steel sink without the cost. Supplied with waste kit, earth tag and sound deadening pads. Standard product is supplied without taps. Stainless steel stands are available as an optional extra if required.

Orwell - Heavy duty pre-wash tap

Orwell Heavy-Duty "Mis-Use Resistant" for the more demanding kitchen environment. Energy-saving construction uses less than 6L/min water at 4-bar pressure when the optional water-saving face plate is fitted, delivering up to 25% water savings in a standard-sized kitchen. Designed for single water feed (usually cold water supply), the AquaJet 50 can be fitted with an optional mixing valve to provide a tempered, mixed water supply. Can be used as a pre-rinse for dirty dishes or food washing and rinsing applications (when connected to potable water source). Pre-assembled and tested for quick installation. Easy to clean and service. Integral restraining cable prevents overstretching and spray gun contact with dish water. Coiled hose absorbs the wear and tear from twisting the gun. Wall-mounting keeps the sink deck clear. Big bore delivery hose produces excellent spray pattern.

Cahors - Grease pack

TP1115

A unique, automatic drain dosing system specifically designed to address the drainage problems found in commercial kitchens. The grease pack is highly developed and with powerful Bio-Enzymatic solution deals with fats, oil and grease leaving staff free to run the kitchen. Grease pack maintains free running drains, decreases odours and avoids blockages. Helps food service operators meet with legislative demands. Grease pack refills are very easy to store, handle and change. No water or electrical connections. Easy to install, use, and to maintain. An effective environmentally friendly commercial solution.

Pland for Education

Environmentally friendly, hygienic and durable stainless steel washrooms are ideal for schools. Stainless steel offers numerous benefits for use in the education sector. Stainless steel is hygienic because it is so easy to clean, which makes it an ideal choice for school and other educational facilities and college washrooms. It is the reason why stainless steel is used in applications where strict hygiene is required such as hospitals, laboratories and kitchens.

Stainless steel has an inherent protective film which reforms immediately if the surface is damaged or scratched so reducing the appearance of blemishes. This makes it ideal for high traffic areas such as school washrooms.

When used in washrooms stainless steel offers physical as well as aesthetic benefits and provides a purity and longevity of design rarely found in other materials. It is corrosion resistant which means that it won't be affected by the surrounding environment.

Strength in stainless steel

Venice - Circular washstation

Venice circular wash station, with radiused outer edge, supplied on a pedestal with service access panel. The centre column contains a large refillable soap tank with plungers and features either hand operation with non concussive taps, foot operated faucets or sensor operation faucets.

Suitable for schools, colleges, service stations and communal washroom environments the unit is pre-plumbed and fitted with a thermostatic mixer valve and a pressure reducing valve making the unit easier to install and commission. The base can be straight or conical shaped and the soap tank takes any standard liquid soap.

We recommend sensor taps for Venice washstations because the 'no touch' technology improves hygiene by reducing the spread of germs and bacteria and also add to BREEAM points for the building. They are also highly effective in saving water and thus reduce costs in use. Sensor taps also prevent scalding because water temperature can be set using the thermostatic mixer valve.

Hand washing areas should be an extension of the circulation space and may be unisex. Experience has shown this reduces the opportunity for anti-social behaviour; the Venice washstation has proved to be an ideal product in these areas.

Trent - Touch sensor tap

TP1082

TP1082

Trent is a basin mounted touch sensor tap. It is available with battery or mains operated power time control. The self closing fitting avoids the risk of taps being left on and together with that allows the user to open and close the faucet according to their needs. With a 20 second factory preset, installation or maintenance staff can easily change this time manually according to the needs of the user. Running time adjustment is not accessible to the end users. Water will start to flow when the user touches the upper cap and will run for 20 second or until the user presses the cap again. Filter included.

Pland for Healthcare

Stainless steel, with its impervious and non-toxic surface, has the characteristic of being quick and easy to clean. This attribute makes it the ideal choice for fixtures and fittings for hospital and healthcare projects. As manufacturers of a comprehensive range of hospital and healthcare products, Pland can offer technical advice to architects, consulting engineers and all those concerned with the specification and selection of hospital sanitaryware and fittings. Pland's range of healthcare products comprises standard items designed for healthcare use and washbasins and other products specifically designed to comply with Health Technical Memoranda (HTM) 63 and 64. Pland healthcare products are available in two grades of austenitic stainless steel, 304 and 316. 304 is the standard grade and is appropriate for most healthcare applications. 316 is a higher quality material and is available on request. It is usually specified for particular applications such as where stronger cleaning agents are necessary.

Corsica - Height adjustable sink

HA1060SR

The Corsica is primarily for use in recovery rooms that aid the recently disabled in adjusting to their new situation. The unit comes with a shallow bowl to allow for wheelchair access. This height adjustable unit is powered from a mains supply and has a 300mm range of motion controlled via the switches located on the front of the unit. A safety "bump" strip located on the valance prevents the unit's downward movement if there is any obstruction. The unit comes with feet as standard but the feet can be removed and the unit wall mounted.

Bathurst - Legionella water filter tap and tap adaptors

SANAQ31F1S2

The Bathurst is a disposable water filter that is protects against waterborne contaminants including Legionella spp. and Pseudomonas spp. Includes a validated layer of sterilising grade filtration with integrated pre-filter for 31 day use. The unit is fully recyclable and is compatible with common systemic heat and chemical disinfection. The benefits are as follows:

- Reduced risk of water associated nosocomial infection
- Documented performance, validated according to international requirements
- Bacteriostatic additives throughout housing materials, minimising risk of inadvertent cross contamination and retrograde contamination
- Added protection from cross-contamination
- Easy to use convenient and cost effective

Pland for Janitorial

Stainless steel's physical strength and durability make it particularly appropriate for janitorial and building maintenance products. Compared to other materials such as ceramics, galvanised iron and plastics, stainless steel provides unparalleled longevity. This is especially relevant where products are being subjected to a tough and demanding life or where corrosive chemicals may be splashed around.

Pland's range of janitorial products share stainless steel's benefit of being easy to clean, a characteristic that makes it the ideal choice for janitorial equipment for hospital, catering and educational sectors.

Strength in stainless steel

Aberdeen - Cleaners sink

Aberdeen cleaners sink with 250mm high splashback and bucket grating. Taking buckets or food containers for rinsing and washing down and the unit is anti-vandal. The sink is fixed to the wall with 4 suitable screws for the wall application through the back of the unit.

Pland for Laboratory

Stainless steel is ideal for applications in medical, scientific, industrial, and commercial laboratories. For many research establishments corrosion resistance and durability are important benefits, whilst in some scientific contexts its non-magnetic properties will be of primary importance.

In all laboratory installations, stainless steel products bring the valuable characteristics of being impervious to most chemicals, easy to clean and of great strength whilst having an aesthetic appearance appropriate to scientific installations.

All Pland laboratory sinks and tables are manufactured with 316 grade stainless steel for improved corrosion resistance.

Pland

Strength in stainless steel

Troy - Sit-on sink tops

LS1560SD

LS1050SR

Sit-on sink tops manufactured in polished 1.4401 (316) grade stainless steel to provide excellent acid and chemical resistance. These products are ideal for use in laboratories, kitchens, hospitals, canteens, clinics, residential homes and universities. Supplied with tap holes at 180mm centres, 29mm overflow, sound deadening pads, fixing clips (where appropriate) and integral earth tag. Sit-on models incorporate safety return fold on front edge and 30mm up stand and turndown. Available without overflow on request. Bespoke 316 grade products can be quoted on request.

Pland for Secure

The requirements for washroom and sanitaryware in prison and anti-vandal installations make it essential that products specified for such applications are durable, tough and should need low maintenance. Specifying Pland products enables designers and building managers to meet those requirements at reasonable cost and within acceptable delivery times.

Almost all of Pland's range of stainless steel products are appropriate for installation where security is paramount. The particular products shown in this section are those which have been proven to be effective plus those which have been designed especially to solve specific security and anti-vandal needs.

Pland have had years of experience in supplying products in secure environments be it police station cells, prisons or other anti vandal solutions here in the UK as well as internationally. We are the best people to talk to if you have bespoke requirements for a secure environment.

Washington - Combination WC and washbasin

SE8000LH

The Washington is made from 1.4301 (304) grade stainless steel, at a thickness of 1.5mm and 2mm. The unit is ideal for duct wall installations so that pipework is completely concealed. The unit can be fixed to the wall with suitable fixings down the rear flange of the unit via the security screwed access panel. Handing can be left or right hand WC. The unit is flushed via a concealed cistern that is to be tank fed and is operated by a push button. Taps are hot and cold non concussive type. The WC can be flushed via flushing valve rather than a cistern. The drawing and image show a typical prison type unit, however layout and fittings can be made to suit individual configuration from a single unit to a complete prison. Products can be foam filled on request.

Pland for Washrooms

Combining robustness with low maintenance, Pland washroom products use the physical properties of stainless steel to bring specific benefits for washroom installations. It's bright and clean appearance enhances washroom installations and engenders reassurance in users.

Stainless steel is highly durable and stable, like glass and ceramics. However it is not brittle and can withstand sudden impacts without cracking or shattering.

The material's robustness and durability mean that Pland stainless steel washroom equipment will have a very long life even in demanding environments such as schools, hospitals, fire stations, prisons and similar institutions.

Pland washroom products are available in two grades of stainless steel, 304 and 316. 304 is the standard grade and is appropriate for most applications. 316 is the higher specification material and is usually provided for particular applications such as laboratory installations and other special uses.

Venice - Circular washstation

Venice circular wash station, with radiused outer edge, supplied on a pedestal with service access panel. The centre column contains a large refillable soap tank with plungers and features either hand operation with non concussive taps, foot operated faucets or sensor operation faucets.

Suitable for schools, colleges, service stations and communal washroom environments the unit is pre-plumbed and fitted with a thermostatic mixer valve and a pressure reducing valve making the unit easier to install and commission. The base can be straight or conical shaped and the soap tank takes any standard liquid soap.

We recommend sensor taps for Venice washstations because the 'no touch' technology improves hygiene by reducing the spread of germs and bacteria and also add to BREEAM points for the building. They are also highly effective in saving water and thus reduce costs in use. Sensor taps also prevent scalding because water temperature can be set using the thermostatic mixer valve.

Hand washing areas should be an extension of the circulation space and may be unisex. Experience has shown this reduces the opportunity for anti-social behaviour; the Venice washstation has proved to be an ideal product in these areas.

Hexham+ Hand dryer

SAN132

SAN132

The Hexham+ represents the next generation of fast drying energy efficient hand dryers designed with the environment in mind. It has exceptional drying performance coupled with the lowest noise levels in its class. The ultimate in modern hand drying the new Hexham+ is perfect for all high traffic applications with reduced power consumption of less than 1.5kw @ 230 volts. Making it altogether a genuinely responsible choice.

Fixby

Recessed warm air dryer

SAN1050

GRAB 304 1.2 SATIN

SAN1050

Fixby is a high performance warm hand air dryer in a durable stainless steel recessed enclosure. Infrared sensors are built into the air outlet to provide automatic operation; the dryer switches on when hands are placed under outlet and switches off when they are moved away. The Fixby has a brushed stainless cover and zinc plated steel backplate. In operation it generates a sound level of 76 dB and has a power rating of 2.6KW at a speed of 4650 rpm.

Trent - Touch sensor tap

TP1082

TP1082

Trent is a basin mounted touch sensor tap. It is available with battery or mains operated power time control. The self closing fitting avoids the risk of taps being left on and together with that allows the user to open and close the faucet according to their needs. With a 20 second factory preset, installation or maintenance staff can easily change this time manually according to the needs of the user. Running time adjustment is not accessible to the end users. Water will start to flow when the user touches the upper cap and will run for 20 seconds or until the user presses the cap again. Filter included.

Irwell - Basin mounted mixer tap

TP1200

TP1200

Single-command automatic shut-off basin mixer, with adjustment for temperature on the control knob. Automatic delayed shut-off ~20 seconds and flow rate 3l/minute, with scale-proof aerator. Maximum temperature limitation and flow rate are adjustable without dismantling the cartridge, nor cutting-off water.

- Open by pressing the push button and automatic delayed shut-off without hand contact.
- Temperature selection by turning the control knob.
- Use: recommended for highly frequented public places, and disabled persons facilities (smooth opening).

Pland for Sanitaryware

Because stainless steel is easy and quick to clean it is the ideal choice of material for sanitaryware. The non-porous, impervious nature of its surface means that it is as hygienic in use as ceramic ware but has the added advantage of being able to withstand impact and sudden shock. Like plastic it is comparatively light in weight and so is appropriate for installations where weight is a criterion, but with the further benefit of great strength and longevity.

Many sanitaryware products are supplied as standard with a polished bright finish. This aids keeping the products clean when in use.

Pland sanitaryware is manufactured to exacting criteria so that it conforms to the appropriate British and European standards whilst being aesthetically pleasing.

Pland for Bespoke Products

We are all justly proud of our company heritage and the international reputation we have built since the company, was founded in Leeds in 1919. We have always been a manufacturer of high quality stainless steel products and are still based on the same site. Over the years we have developed a highly skilled workforce employing many true craftsmen, often with generations of the same family working for us. Their loyalty and time served experience, coupled with our modern production and in-house CAD capabilities have been and remain central to our success.

With this experience in manipulating stainless steel, Pland are your ideal partner to produce bespoke products. Couple this with the CAD/CAM capabilities we can develop from concept or specification through to finished product within a matter of weeks. Whether the requirement is a one off order or part of a larger project that may require a small percentage of special products to complete a final offering.

The following section showcases just some of the projects that we have been engaged in and gives a feel of the various sectors where we are able to assist.

Strength in stainless steel

Janitorial Unit - Case Study

Cleanliness and hygiene are the core to any hospital, so when the Royal Victoria Hospital in Belfast required new Janitorial units they chose the Pland 'Samoa'. Pland have over the years, built on strong relationships with Merchants in Belfast and were able to supply their product to the trust via the local merchant from stock.

Pland's customer commented "The Pland janitorial unit meets the demand of HTMG4 specification, whilst offering the safeguards of WRAS approval, an attractive package at a competitive price".

The SAMOA is a free standing combination janitorial unit, which is supplied complete with hinged grid and WRAS approved swivel monobloc mixer tap. The unit is adaptable and can be either floor mounted or wall mounted with the supplied mounting bracket. It meets all the latest specifications and is widely used in hospitals, care homes, institutions and catering establishments throughout the UK and internationally.

Trust Pland to deliver, strength in stainless steel.

Robert Gordon University - Laboratory Equipment

Troy Sink

Pland have supplied Aberdeen's Robert Gordon University with both standard and bespoke laboratory equipment.

Working closely with various furniture suppliers Pland supplied a range of non-standard laboratory sinks manufactured in 316 grade specification stainless steel with special tap hole centres and no overflows. From our standard range, we were able to supply a complete range of self rimmed Syracuse bowls to complement the non-standard products.

Bespoke triple bowl double drainer inset sinks were designed to meet the architects exacting requirements and to ensure demanding standards were met they were also provided in 316 grade material throughout.

The Pland range of Troy laboratory sinks offer excellent resistance to acids and chemicals whilst offering a pleasing aesthetic appearance. Trust Pland, strength in stainless steel.

Science students

School of Pharmacy and Life Sciences, new purpose-built facility

Secure - Shower Cubicles

Shower Cubicle

When the Ministry of Justice were looking to refurbish prisons in Durham, the appointed contractor looked to Pland for the supply of 33no shower cubicles.

Working in close cooperation with the contractor, Pland suggested the "Lisbon" range of shower cubicles, and quickly drew up details to meet the architect's design brief.

Pland were able to supply interactive drawings that allowed the customer to fully appreciate our interpretation of the architect's design and needless to say, the customer and architect were delighted with this aspect.

The "Lisbon" cubicles can either be supplied as individual units to suit single installations or be fitted together in a range to suit a shower block. They can be supplied either in a fully welded construction or as a flat pack for assembly on site where space restricts access as a fully welded unit. Usually they are supplied complete with integral non concussive valve and anti-ligature shower head as standard but are available with a range of options to suit the individual project, including end panels and shower curtains if required.

As can be expected of Pland we delivered on time, and to the correct specification.

Trust Pland, Strength in Stainless Steel.

Whitehorse Manor Infant School - Full Project

Sinktop from Pland Stainless

We have recently completed a bespoke solution for the above school in Croydon and were chosen by the Contractor based on our excellent reputation for delivering specialised projects in the Education sector. Stainless Steel was specified by the Architect for its durability in this cutting edge design. This is a project we can be proud of and one that we can showcase to other contractors when quoting for further Education contracts.

University of St Andrews - Full Project

Pland is pleased to announce that when St Andrews University decided to upgrade its student accommodation, Pland was the university's first choice. Pland assisted by supplying its Planet range of base cabinets, wall cupboards, sinks and worktops to sit alongside the existing units Pland had supplied 10 years earlier. The programme of works had to be completed within ten weeks from inception to handover and, as you should expect, Pland delivered!

University of St Andrews
Scotland's first university

John Ferneley College - Full Project

Venice Washstation

When John Ferneley College embarked on its 'Enrichment Centre' the college again turned to Pland to supply the pupils' washroom facilities. As Pland had successfully commissioned them in the first phase (2010) we were a natural choice.

The building is outstanding in its green credentials and includes a wind turbine. Pland's Venice washstation complements the green theme well with its sensor operation, water temperature controls and 100% recyclability.

Miscellaneous - Bespoke Catering Projects from Pland Stainless

Bespoke Kitchen Units

Pland are able to provide full design facilities including preliminary site surveys to help you create the perfect kitchen. Using either their standard range of products suited together or incorporating bespoke worktops/sinks that are made to fit a space, you can be assured that Pland will work with you to meet your requirements. Pland are able to provide anything from servery counters for "pass through" hatches, through to large sinks with unusual size bowls. We are quite used to being asked for the unusual, so don't be frightened to ask.

Poggenpohl Design Centre Leeds - Champagne sink

Poggenpohl Design Centre Leeds

When looking for a local manufacturer to make a bespoke stainless steel "Champagne Sink" for a new feature showroom display, Natalie Fry the Designer at Poggenpohl Design Centre Leeds approached Pland Stainless to provide a solution. Poggenpohl are a German designer kitchen manufacturer who were established in 1892 and are present in over 70 countries worldwide. The basic brief for the sink was that it needed to be 2m long and mount into a Acrylic type bespoke worktop. The unit was to be used to store Champagne and other drinks on ice. Gary Pearson, Technical Estimator for Pland Stainless sent Natalie a series of drawings for products Pland had produced for other clients to give her an idea of what could be done for this brief. Natalie was then invited to the Pland factory in Lower Wortley, Leeds to see the production facility and discuss in detail a full brief for this sink. From this brief the Pland design team created drawings and a 3D CAD model of the proposed sink and once approved by Natalie this unit went into manufacture.

As you will see from the photograph below, this sink was fitted into a beautiful white feature island in the main display and formed the centre piece for a large launch event for the new ranges presented by Poggenpohl. Feedback on this unit was extremely positive from both prospective clients and local interior designers.

Royal Derby Hospital - Case Study

Royal Derby Hospital

Royal Derby Hospital Bespoke Foot Wash

Pland supplied a range of HTM 63 and 64 healthcare products in both standard and bespoke designs. The wide array of products supplied included a stainless steel foot trough for a multi-faith prayer room.

The London Hospital - Case Study

The London Hospital Bespoke Units

The London Hospital

Scrub Up

Pland have supplied The London hospital with standard and non-standard healthcare equipment.

Working closely with various furniture suppliers, Pland developed a range of base and cupboard units to match the hospital's requirements. HTM63 worktops were designed to specially match the customers profile and lengths, and to ensure demanding standards were met, different specifications of stainless steel were used for different room requirements.

Pland also supplied the complete range of HTM64 products, including slop hoppers, scrub up troughs, and plaster sinks.

Pland also developed an entire suite of endoscopy sinks for the hospital, each one different complete with deep sinks and hand fabricated bowls. The products included integral large up-stands with stainless steel cabinetry below.

Trust Pland to deliver, Strength in Stainless Steel.

King's Mill Hospital - Case Study

Pland Stainless healthcare range provided this new hospital with a hygienic, durable and easy to clean solution. A full range of HTM 63 and 64 standard and bespoke stainless steel designs were supplied.

Nuffield Health - Tees Hospital

Endoscopy Sink

Pland are renowned for their offer of healthcare sinks, all usually supplied to either HTM64 or HTM63 specification, however less well known is Pland's ability to supply bespoke Healthcare products. When Nuffield Health wanted a special size Endoscopy sink for their facility, Pland designed and manufactured precisely the sink they required for the project. By their very nature, endoscopes do not lend themselves to standard size bowls, so we manufactured a 316 grade, twin bowl unit with tapholes at the end to suit this unique requirement. On the same project, there was a requirement for a triple bowl unit, which we also provided, demonstrating the diversity of products Pland can design and manufacture.

Ayrshire Athletics Arena - Changing Room Wash Area

Changing Room Toilets

Pland have supplied Kilmarnock's Ayrshire Athletic with a range of standard and non-standard sanitaryware.

Working closely with the architect Pland designed and supplied a range of Prague wall mounted washbasins from 304 specification stainless steel with special tap hole centres. The units were designed to include a full shroud to the floor and with access panels to the front for services.

Pland also supplied a complete range of Calvi wall mounted stainless steel back to wall shrouded WC pans completely factory fitted with seats and ready for installation.

Due to its properties stainless steel was the preferred option of sanitary ware for this high usage area. Robust designs and hygienic requirements made stainless steel the obvious choice and Pland, the first choice for supply.

Trust Pland, strength in stainless steel.

KPMG Broadgate - Foot Troughs

Broadgate Atrium

Following on from our recent success in the design & supply of the Multi Faith Foot Wash Station for KPMG (also known as a 'WUDU') installed in the Canada Square Building at Canary Wharf, London, we have again been approached to design & supply a similar unit to go into their offices in Leeds based at the Broadgate Building on the Headrow, Leeds. There was a minor design change on the Foot station itself and additionally our design team was asked to come up with a bespoke hand wash unit that would fit nicely to the end. We were challenged with the fact that they wanted the units design to follow the aesthetics of the Foot Station. With the use of the latest 3D Modelling software we were able to offer drawings & 3D images so that the customer could see beforehand our exact interpretation of their design requirements prior to manufacture.

Mark Mulvaney, Site Manager at the Broadgate, Leeds, reports that the trouble-free installation of the second unit is to the client's complete satisfaction. Another great job from the team at Pland!

O² Matter Nightclub - Washrooms

Bespoke Sinks

Nightclub at The O², South-East London. WCs, cisterns, urinals and a variety of standard and bespoke wash troughs, all manufactured from stainless steel, were a crucial part of making 'Matter' a world class live music and club venue. Pland Stainless literally had to pull out all the stops to help complete the project on schedule, which meant supplying bespoke wash troughs on a three week leadtime.

Pland Stainless was specified by world renowned Pentagram design house because its products helped create a modern contemporary look as well as being hardwearing and resistant to vandalism.

Work on site has been carried out by Collins Construction PLC.

The high number of people expected to visit meant that Pland was required to supply special wash troughs. Again manufactured in stainless steel, these bespoke designs were required because the washrooms have WC cubicles that run along both sides - to cope with the high volumes of people. This created a need for bespoke double sided wash troughs, with four separate bowls and taps located at each end. The fact that Pland was able to supply bespoke items on a three week leadtime is a testament to it's manufacturing capability and customer service responsiveness. 'Matter' now has a total of 86 WC cubicles including VIP washroom facilities, all of which were supplied by Pland Stainless.
